

Dental Treatment at the Veterinary Health Centre

First of all, don't worry - dental treatment at the Veterinary Health Centre is a very routine procedure. We will do all we can to make it easy for you and your cat.

We begin the gentle anaesthetic by giving a tiny injection. The patient relaxes peacefully and in about 10 minutes is asleep in light anaesthesia. An analgesic is given to prevent any discomfort on recovery. A pulse oximeter is used to monitor heart rate and oxygen levels in the blood.

Then we sort out any dental problems. We remove all hardened tartar, and polish the enamel to reduce plaque formation in the future. We do all we can to preserve the teeth, but any loose, or decayed teeth will be removed. Antibiotics to clear infection will be used as necessary. All patients receive effective pain relief medication as required. Older cats or those with kidney problems or active infection may need fluid therapy (I/V) during the procedure. **It doesn't take very long.** We need your cat at the surgery for just a few hours. Admission 8.30am - 9.00am, discharge 3.00pm - 5.30pm.

A ROUTINE BLOOD TEST is recommended at the time of any anaesthetic to check for any hidden problems that might interfere with healing during recovery. Our in-house laboratory gives us results within the hour.

IF YOU WOULD LIKE TO STAY WITH YOUR CAT while the anaesthetic is given, or during recovery you are most welcome. Please tell the receptionist you would like to stay with your pet as you fix your pet's dental appointment. There is a charge for this service.

OTHER MINOR MEDICAL PROBLEMS such as cysts, warts, small growths etc. can be dealt with at the same time. (ask for an estimate)

◆ **Pet Health Insurance** will normally cover dental problems such as gingivitis, dental caries and extractions. It may not cover routine dentals where there is no medical condition. If in doubt, ask the vet.
